

Restore a Habitat Challenge

Grades: 9 to 12

Topics: Green & Climate

Engineering Disciplines: Environmental, Agricultural & Biological,
Project Management

Restore a Habitat Challenge

Plan the restoration of a degraded habitat in your community so that it benefits native plants and animals.

This project asks students to research what an area in their community was like before human activity changed it. What plants and animals flourished there? Which ones remain? What native species have been driven away? What non-native species have moved in?

Once students are familiar with an area's natural history, they consider how it could be improved to help those native species struggling to survive and maybe even lure native species back once their habitat has been restored. Students determine engineering-based solutions to reclaim the health of that habitat.

Throughout the project, they will use the Engineering Design Process (a series of steps that is helpful to solve a problem) and Project Management (the use of knowledge, skills, tools, and techniques to deliver a product or result) to develop their solution.

Materials and Resources

Included with this module:

- *Restore a Habitat Challenge Student Handout*
- *Glossary of Project Management Terms*
- *Project Rubric*
- *Appendix of Project Management Templates*

Included separately:

- *Introduction to Project Management module*

Before starting the Restore a Habitat Challenge, ask students to review the introductory module to get familiar with project management and key tools. discovere.org/stem-activities/introduction-to-project-management/

Before Students Begin

The Restore a Habitat Project has been written as an open-ended challenge where local needs and conditions will drive the students' solutions. With this in mind, there are some things you (the educator or STEM leader) will need to consider before the students start.

Who is the client?

A project's scope is determined by the client, who sets the deliverables, deadline, constraints, and resources. This challenge assumes the educator or STEM leader will serve as the client, but you can also ask your local wildlife education center, conservation organization, or engineering college or company working on habitat restoration in your area if they have employees or undergraduates who would like to be the client.

Project Scope

Well-defined project deliverables and outcomes are key to your students' success. While they are responsible for identifying the problem they want to address, you should determine how they will present their solution. Note: Determining scope will be a critical part of this project because most restoration projects occur in phases over a lengthy period of time. Will students:

- Build a model or prototype?
- Produce CAD drawings or videos?
- Submit a proposal to a local agency?
- Present their solution to classmates, local experts, or public officials?
- Design and lead implementation of their solution?

As you think through these options, how will the final product be assessed? An assessment rubric is available for you to customize for your students.

Constraints and Resources

An engineering constraint is any limitation on your design. A resource is anything needed to plan and build an engineering project, such as materials or people's work efforts.

- Are there any project constraints that the students need to be aware of?
- What is the time frame for the project?
- What resources are available? Do they have a budget to purchase the necessary materials for a prototype or model?
- Are there subject matter experts (SMEs) who can serve as advisors or are available during the research phase?
- Are there any permissions that need to be secured before the students begin?

Academic Standards

This project meets the following Next Gen Science Standards:

- **HS-LS2-7 Ecosystems: Interactions, Energy, and Dynamics**
Design, evaluate, and refine a solution for reducing the impacts of human activities on the environment and biodiversity.
- **HS-ESS3-4 Earth and Human Activity**
Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.
- **HS-ETS1-2 Engineering Design**
Design a solution to a complex real-world problem by breaking it down into smaller, more manageable problems that can be solved through engineering.

Student Handout

Restore a Habitat Challenge

Picture your community—its busy areas, neighborhoods, parks, and water sources such as lakes or streams. Now imagine your community the year you were born. What animals and plants lived there? Do they still live there? What about 50 or 100 years ago?

A habitat is a place within an ecosystem where a plant or animal lives. Living things have evolved to thrive in their native habitat, with a particular landscape, climate, dominant vegetation, and water source. When a habitat becomes polluted, overtaken by invasive non-native species, broken into small pockets by highways or subdivisions, or degraded by other sources of rapid change, many species will not be able to adapt. Habitat destruction is causing countless plants and animals to drastically decline in number, some to the point of extinction.

Environmental engineers reverse the process of habitat loss by working with biologists, ecologists, conservationists, geologists, and many other kinds of scientists to restore habitat. The work requires a deep knowledge of the ecology and natural history of a particular environment, as well as the ability to think ahead and plan for future potential threats to a habitat's well-being.

Your challenge: *Plan the restoration of a degraded habitat in your community so that it benefits native plants and animals.*

You may choose to focus your efforts on saving a particular species. But your solution will do more than enable one species to flourish because a habitat that is restored for one species benefits so many more—including the people who live nearby. As you develop your solution, you will use the Engineering Design Process (a series of steps that is helpful to solve a problem) and Project Management (the use of knowledge, skills, tools, and techniques to deliver a product or result).

Habitat restoration benefits humans as well as native plants and animals. When engineers succeed at reclaiming wetlands, for example, nearby neighborhoods are protected from the worsening storm surges brought about by climate change. Meadows infested with non-native plants transform when they are full of natives again. Native insect pollinators return to the food sources they have been adapted for; insects such as native bees also pollinate our fruit trees and vegetable gardens. Native birds and reptiles return that eat those insects. Owls, hawks, foxes, and other animals come back. These predators keep balance in the restored habitat—and keep rodent populations in check.

Initiating Your Project

Successful projects require much forethought as well as flexibility along the way. The first step in project management is to initiate your project with your client (this may be your teacher, a volunteer leader, or an outside community member) to learn the project parameters and scope.

If you haven't already, now's the time to review the **Introduction to Project Management** module. It takes you through an example project and shows you how to use a set of project management tools that are useful in any project, including this one. discovere.org/stem-activities/introduction-to-project-management/

Here are a few questions to get your Restore a Habitat project started:

- What is the project deliverable (e.g., a prototype, presentation, video), and how will your team be assessed?
- What is the scope of your project?
- Who is on your team?
- What is the deadline for completing the project?
- What resources are available to you, is there a project budget, and are you allowed to access additional resources beyond what is being provided?
- Are there any project constraints? Limitations or conditions must be considered as you develop your solution.
- Will you have access to subject matter experts or will you be able to conduct interviews with community members who know about current policy and problems with local habitat degradation?
- What other questions do you have?

Research Resources

- About habitat restoration engineers:

- Re-introducing wolves to Yellowstone National Park caused unexpected changes:
<https://www.youtube.com/watch?v=W88Sact1kws>

Identifying the Problem

Step one of the Engineering Design Process is to identify the problem. Start by learning about the species of native plants and animals that are in decline or struggling in your vicinity. Here are some questions to get you started:

- Research the natural history of your community. What was it like before humans settled there? How has human development changed the landscape?
- What animals and plants once thrived in your area that are no longer thriving or are completely gone?
- What non-native plants and animals have moved in?
- Which species of plants and animals are listed as threatened or endangered in your area? Animals include insects, reptiles, fish, and birds, not just mammals. Choose several to do more research on.
- Research what work is being done, if any, to restore habitat in or near your community. What worked for these projects? What didn't?
- How do engineers typically restore the type of habitat you're researching? How might their methods or process be improved?
- Is there a company or nonprofit in your community that employs habitat restoration engineers? They work with other kinds of engineers and many different scientists to restore habitat.
- What is one local area where a restoration effort could make a big difference in the ability of native plants and animals to thrive?

Some habitat restoration projects are beyond the scope of this project, such as removing a dam to restore a major river. Focus on a habitat that is within the scope of your team's ability to improve.

Planning Your Project

Now that you've learned more about the issue and the project scope and parameters, your team is ready to make your project plan.

Choosing Roles

Dividing up all of the work means that nobody carries the whole load and everyone has an important part to play in the project. It also means that each person does what they feel ready and able to do. They can use their skills and do the part that interests them.

Here's a list of typical project roles. You'll need to determine which of these are needed for your project, as well as any other roles that make sense to you. Also, be sure to plan which team members will need to take on multiple roles.

- Project manager
- Scheduler
- Builder
- Note taker
- Researcher
- Designer
- Tester
- Presenter

Capture all the people affected by your project by filling out a Stakeholder Register.

Building Your Schedule

The schedule tells each team member what the deadline is for their particular responsibilities. It may also mean that not everyone is working on the project at the same time; for example, if your role is to create a CAD drawing, you need to hit your deadline in the schedule so that the presenter(s) have time to prepare for the presentation.

Remember that your schedule has to be flexible. Some parts of this project might take longer than anticipated, so know ahead of time that you will probably need to adjust as you go. That's what engineers and project managers have to do all the time—be ready for plans to change!

There are many ways to keep track of what needs doing, when, and in what order.

- With scheduling programs on a computer include Excel spreadsheets, Google Sheets, and Apple Numbers
- On smartphones: Trello, Asana
- Or use the templates in the Appendix

Research

Now's the time to go deeper into the research and find potential solutions.

As you research, jot down any ideas that emerge for your particular problem and how they might be solved. Keep careful track of where you get your information so you can go back to the source as needed.

Consulting a subject matter expert (SME) is a great idea to bolster your online research. SMEs are professionals with expertise in a particular subject who can give you important information that will affect your understanding of the problem, how the problem plays out in your community, and what solutions are already being considered. You can find SMEs at your local college or university, engineering firms, and relevant government organizations.

Brainstorm Solutions

Come together with your group and talk about what you've learned from your research. Let the ideas for solutions flow. Don't shoot any down; just gather a bunch and see where they lead. Eventually, choose one idea for a solution to work with (but keep your list in case the first idea doesn't work out).

As you are brainstorming, check in with your client to make sure you can deliver your solution on time and on budget. Make sure you understand how they'd like you to deliver your solution and how your solution will be assessed. If there are any new details or misunderstandings, now is the time to resolve them. For instance, maybe your potential solution doesn't fit within the scope of the project, or it would be better suited to a different presentation method. Talk with your client and see if the project specifications can be adapted.

Check the Project Management Templates in the Appendix and see which ones would be helpful for your project. Everyone needs a budget and a way to track expenses; what about listing the resources you need, troubleshooting risks, and creating a system for communicating often and effectively?

Executing & Monitoring Your Project

Now's the time to develop your deliverable or project outcome. If you are making a prototype or a model, build one now. If you are developing a design that could be built in the future, think through every step of how you would build it. Look for trouble spots and think about how to handle them. Do a rough draft or sketch before designing the final version.

Test your prototype or model. If it worked, how could it work better? If it didn't, redesign and try again. Engineers recognize that their first prototypes are rarely their best. They go back to the drawing board, however many times it takes.

If you are doing a presentation as part of your project deliverable, consider what you want to present and any supporting materials you may need to develop (e.g., background information, models, prototypes). Consider the following questions when producing your presentation:

- How much time will you have for your presentation?
- Who will the audience be?
- Will there be a Q&A session?
- How will your work be assessed?

As you work, a few things to consider in this phase are:

- **Your Schedule:** Go back to your schedule and see what tasks you are assigned. You may need to switch roles or change dates at this point.
- **Scope Creep:** This common phenomenon happens when your idea for a project deliverable keeps growing until it is way bigger than you can actually do. If you have a client, are you being asked to do more than you're able? Now is the time to renegotiate.
- **Group Check-ins:** Check in with the team and see how all of the pieces are moving along. Check in regularly!
- **Status Reports:** Your client will want assurances that the project is going as planned—or that change is required. Remember to keep your client posted by providing a status report like the one in the Appendix.

Close

Share your results! Be prepared for some questions and feedback from your client.

At this stage, take some time to reflect on your experience and the work of others. This is a critical phase in the Engineering Design Process as well as Project Management. Part of your reflection includes thinking about what you did well and what you'd like to do better; it's also important to look as objectively as possible at the work of your teammates.

Write a Lessons Learned Report and a Self- and Peer Assessment by using the forms in the Appendix or creating your own.

We want to see what you and your teammates develop!

Share your project results with us at Social@DiscoverE.org or tag us [@DiscoverEorg](https://twitter.com/DiscoverEorg)

Glossary of Project Management Terms

Acceptance criteria: A set of conditions that must be met before deliverables are accepted.

Activity: A distinct, scheduled portion of work performed during the course of a project to meet a project milestone.

Budget: The estimated amount the project will cost, including labor, supplies, and overhead (office space and equipment).

Closing process: The process(es) performed to formally complete or close a project.

Constraint: A limiting factor that affects the execution of a project, such as time or money.

Deliverable: What is delivered to the client as a result of the project. Deliverables can be products or completed activities; projects usually create deliverables during the project, such as progress reports, as well as the final deliverable.

Executing process: The doing phase of a project; work is completed until the project goals are achieved.

Goals: The main purposes of the project; the general outcomes you want to achieve.

Initiating process: The first steps of a project. These include coming up with a project idea, vetting it, identifying stakeholders, choosing the project manager and team, and getting the project authorized.

Milestone: A significant point or event in a project that marks progress toward the project's completion.

Monitoring/controlling process: The processes of tracking, reviewing, and regulating the progress and performance of the project. During this phase, any needed changes are identified, and the team prepares to make those changes.

Objectives: The specific and measurable outcomes that need to be achieved to fulfill project goals.

Planning process: The phase of a project set in motion after it has been approved, during which many key decisions are made. These include writing the scope statement, project schedule, and budget. It also includes deciding how to monitor the project's progress, who will do what, how to obtain resources, how and when to communicate with project stakeholders, and thinking ahead about handling potential risks and pitfalls.

Project: A temporary endeavor undertaken to create a unique product, service, or result that has value to people.

Glossary of Project Management Terms (continued)

Project management: The use of specific knowledge, tools, and techniques to ensure that a project comes to successful fruition.

Project manager: The person chosen to lead the team who is responsible for completing the project.

Project portfolio: A collection of all the documents generated over the course of a project.

Project schedule: A detailed layout of a project's timeline that provides a start date and a due date for all project milestones, activities, and tasks.

Project scope: Description of the project's limits in terms of its cost, time frame, and objectives.

Project team: A set of individuals who support the project manager in performing the work of the project to achieve its objectives.

Resource: Anything needed to complete the project—people, tools, money, time, and facilities, for example.

Risk: A potential event or condition that can have a negative effect on the project.

Scope creep: The uncontrolled expansion of the project scope without adjustments to time, cost, and resources; when goals get added that weren't part of the original scope.

Scope statement: The formal description of a project's scope. The scope statement describes the work that will be done as well as what won't be done to create the project's unique outcome.

Sign off: Approve or agree with a decision.

Sponsor: A person or group who provides resources and support for the project. A project sponsor is responsible for enabling success.

Stakeholder: A person, group, or organization that has something to gain or lose from a project's outcome; anyone with an interest or investment in a project.

Stakeholder register: A project document that lists project stakeholders and relevant information about them.

Status report: The document that details progress toward completion of the project.

Task: The discrete steps that must be accomplished to complete a project activity. **Dependent tasks** are steps that can only be taken if the previous steps are done; **independent tasks** are not contingent on other tasks and can be done within a more flexible time frame.

Project Rubric

Student Names: _____ Date: _____

Project Title: _____

	Exemplary	Solid	Developing	Needs Attention
Comprehension of Subject Matter	All content is accurate and complete and communicates a full understanding of the topic.	Most of the content is accurate and shows mastery of the topic.	Content shows some flaws and omissions and illustrates only partial knowledge of the topic.	Much of the content is inaccurate and confusing and communicates very little understanding of the topic.
Quality of Research	Research includes multiple, varied sources that are cited at appropriate points and that contribute valuable information to the project.	Research includes several sources that are cited at some point in the project and that contribute relevant information.	Research includes at least a few sources that are cited, but the information contributed is only partially relevant and useful.	Research is inadequate or does not contribute relevant information to the project. Research sources cannot be checked.
EDP & Engineering-based Solutions	The Engineering Design Process has been followed, and engineers could implement the solutions.	Most elements of the Engineering Design Process have been followed, and engineers could implement the solutions.	Only some elements of the Engineering Design Process have been followed, and not all solutions are engineering-based.	The Engineering Design Process was not followed, and the solutions are not engineering-based.
Problem/Solution	The problem has been clearly defined, and the proposed solution is innovative and well considered.	The problem has been adequately defined, and the proposed solution is sensible.	The problem has not been well defined, and the solution is not necessarily actionable.	The problem is defined confusingly, and the solution does not make sense.

Project Rubric (continued)

	Exemplary	Solid	Developing	Needs Attention
Project Management Implementation	The team makes effective use of all appropriate project management principles and tools.	The team makes use of most appropriate project management principles and tools.	The team makes use of some appropriate project management principles and tools.	The team does not make good use of appropriate project management principles or tools.
Group Work	All of the group members participated completely and enthusiastically, exceeding expectations for the assignment tasks.	All of the group members participated completely, meeting all of the requirements for the assignment tasks.	Most of the group members participated, completing most of the requirements for the assignment tasks.	Some of the group members did not participate, causing the group to miss some of the requirements for the assignment tasks.
Risk Management	The team's response to problems or setbacks demonstrated flexibility, resourcefulness, and practicality.	The team's response to problems or setbacks demonstrated flexibility and willingness to ask for help when needed.	The team's response to problems or setbacks was somewhat disorganized, or the team did not ask for help when needed.	The team's response to problems or setbacks was chaotic or inappropriate.
Presentation Characteristics (if applicable)	Presentation is logically organized, complete, and persuasive.	Presentation is logically organized and complete.	Presentation is not well organized or is missing a few important elements.	Presentation is disorganized and obviously incomplete.

Additional Comments:

Appendix of Project Management Templates

Templates are a type of tool that give you a basic layout for creating your own versions of documents. You may use the templates in this Appendix to guide your Project Management Processes. Either print the PDFs in this appendix or download editable Word documents at this URL: discovere.org/stem-activities/introduction-to-project-management/
